On fibre spaces in which the fibre is contractible

E. H. SPANIER¹⁾ and J. H. C. WHITEHEAD

Dedicated to H. Hopf on his 60th birthday

1. Let $f : X \rightarrow Y$ be a map of a space X in a space Y and let $A = f^{-1}y_0$, for some point $y_0 \in Y$. Let A be either a locally finite CW -complex, as defined in [16], or a compactum which is an ANR . Then so are $A \times A$ and²⁾

$$A \vee A = (A \times a_0) \cup (a_0 \times A) \subset A \times A \quad (a_0 \in A) .$$

We assume that the covering homotopy theorem is valid with respect to f for any map $g : A \times A \rightarrow X$ and any homotopy of $f \circ g$. This will be so if f determines a fibering of X with a local product representation ([13], § 11.7, and [7], § 5). Subject to the latter condition we describe f as a *bundle mapping*. In § 3 below we prove :

Theorem (1.1). *If A is contractible in X it is an H -space³⁾.*

The method of proof is suggested by the following observation and an (unpublished) construction, due to M. G. Barratt, for defining the “generalized Whitehead product”, $[\alpha, \beta] \in \pi_{m+n-1}(X, A)$, of given elements $\alpha \in \pi_m(X, A)$, $\beta \in \pi_n(A)$. Let f be a fibre mapping. Since $f_* \beta = 0$ it follows that $f_*[\alpha, \beta] = [f_* \alpha, 0] = 0$, where each f_* denotes the appropriate homomorphism induced by f . Therefore $[\alpha, \beta] = 0$. We have $\partial[\alpha, \beta] = \pm [\partial\alpha, \beta]$, where

$$\partial : \pi_{q+1}(X, A) \rightarrow \pi_q(A)$$

is the boundary homomorphism and $[\beta', \beta] \in \pi_{m+n-2}(A)$ is the ordinary Whitehead product of $\beta' \in \pi_{m-1}(A)$ and β . Hence it follows that

¹⁾ This note arose out of consultations during the tenure of a John Simon Guggenheim Memorial Fellowship by Spanier.

²⁾ The fact that, if A is an ANR compactum, so is $A \vee A$, follows from Theorem 1 in [15].

³⁾ i. e. there is a map $h : A \times A \rightarrow A$ such that $h(a, a_1) = h(a_1, a) = a$ for some a_1 and every $a \in A$.

$[\beta', \beta] = 0$ if $i_*\beta' = 0$, where $i_* : \pi_{m-1}(A) \rightarrow \pi_{m-1}(X)$ is the injection. In particular $\pi_1(A)$ is Abelian if X is simply connected (cf. [14], p. 289).

Before considering the consequences of (1.1), in its full generality, we draw a corollary from the preceding observation. Let X be a finite dimensional, locally compact, separable metric space, which is an AR (absolute retract). Let $f : X \rightarrow Y$ be a bundle mapping with a connected fibre A . Since X is an AR it follows from an argument on p. 467 of [12] that A is acyclic and from the above observation that $\pi_1(A)$ is Abelian. Therefore $\pi_1(A) \approx H'_1(A) = 0$, where $H'_n(A)$ is the n^{th} integral, singular homology group of A . Therefore $\pi_n(A) \approx H'_n(A) = 0$ for every $n \geq 1$. It follows from the local product representation that A is a neighbourhood retract of X and hence an ANR . Since X is locally compact so, obviously, is A and since $\dim A \leq \dim X < \infty$ it follows that A may be imbedded as a closed⁴⁾ sub-set in some Euclidean space, E , of which it is a neighbourhood retract. Since A is connected and $\pi_n(A) = 0$ for every $n \geq 1$ it follows that A is a retract of E , and hence an AR . The map f is obviously open and it follows without difficulty that Y is a C_σ -space, as defined in § 11.3 of [13]. In particular Y is covered by a countable set of open sub-sets, U_1, U_2, \dots such that \bar{U}_i , the closure of U_i , lies in a coordinate neighbourhood V_i (i. e. a neighbourhood such that $f^{-1}V_i$ is represented as $A \times V_i$). Let $Y_n = \bar{U}_1 \cup \dots \cup \bar{U}_n$ ($n \geq 1$) and assume that there is a map $g_n : Y_n \rightarrow X$ such that $fg_n y = y$ for every $y \in Y_n$. It follows from the local product representation that this is so if $n = 1$. Let $T_{n+1} = \bar{U}_{n+1} \cap Y_n$. Then T_{n+1} is a closed sub-set of \bar{U}_{n+1} and the latter is a separable metric space, since it is homeomorphic to a sub-set of X . Since A is an AR it follows that every map $T_{n+1} \rightarrow A$ has an extension $\bar{U}_{n+1} \rightarrow A$. Therefore it follows from the local product representation that g_n has an extension $g_{n+1} : Y_{n+1} \rightarrow X$ such that $fg_{n+1} y = y$ ($y \in Y_{n+1}$). Hence it follows by induction on n that f has a right inverse, $g : Y \rightarrow X$, by means of which Y may be imbedded in X in such a way that f becomes a retraction. Therefore Y is an AR and it follows from § 11.6 in [13] that X , as a bundle over Y , is equivalent to the product $A \times Y$. That is to say there is a homeomorphism $h : A \times Y \rightarrow X$, onto X , such that $h(A \times y) = f^{-1}y$ for every $y \in Y$. Thus we have :

⁴⁾ By the addition of a single point, c , we can imbed A in a compactum, C , such that $\dim C \leq \dim A + 1$. We imbed C in a p -sphere, S^p , for some large value of p , and $E = S^p - c$.

Theorem (1.2). *Any fibre bundle with a connected fibre, which, as a space, is a finite dimensional, locally compact, separable metric AR , is equivalent to a product bundle.*

It follows from the arguments in [13] that, if G is a topological transformation group of A and if X is a bundle with G as its group, then (1.2) is valid if equivalence is interpreted as equivalence with respect to G .

We now turn to the consequences of (1.1). Let $f : X \rightarrow Y$ be a bundle mapping of a compactum X . Since f is an open mapping onto Y it follows that Y, A are compacta ($A = f^{-1}y_0$). Let A be connected, contractible in X and an ANR . Since A is a neighbourhood retract of X it will certainly be an ANR if X is an ANR . Let $\dim X < \infty$. Then $\dim A, \dim Y \leq \dim X < \infty$ in consequence of the local product representation. Let $H^*(P, G), H^n(P, G)$ denote the (discrete) Čech cohomology ring and the n^{th} Čech cohomology group of a given compactum P , with coefficients in a given ring G . We assume that Y is locally and globally pathwise connected and that $\pi_1(Y)$, operating on $H^*(A, G)$ as in [9], operates simply for every G . Since A is connected, and hence pathwise connected, this will certainly be the case if X is simply connected. For then $\pi_1(Y) = 1$. Let I_0, R and S^n denote respectively the ring of integers, the ring of rational numbers and an n -sphere. We write $H^*(P, I_0) = H^*(P), H^i(P, I_0) = H^i(P)$. In § 3 we prove :

Theorem (1.3). *Let $H^*(X) \approx H^*(S^n)$ ($n \geq 1$). Then :*

- a) *either A is an⁵⁾ AR or $H^*(A, R) \approx H^*(S^q, R)$, for some odd value of q ,*
- b) *if A is homeomorphic to a topological product, $A_1 \times A_2$, then one of A_1, A_2 is an AR .*

In consequence of the second alternative in (1.3a) we have the exact sequence of Gysin ([3], [9], Ch. III)

$$\dots \xrightarrow{f^*} H^{j-1}(X, R) \rightarrow H^{j-q-1}(Y, R) \xrightarrow{\theta} H^j(Y, R) \xrightarrow{f^*} \dots,$$

in which $\theta v = v \cup \Omega$ for some $\Omega \in H^{q+1}(Y, R)$. Since $\dim Y < \infty$ there is a $k \geq 0$ such that $\Omega^k \neq 0, \Omega^{k+1} = 0$, where $\Omega^0 = 1 \in H^0(Y, R), \Omega^r = \Omega \cup \dots \cup \Omega \in H^{r(q+1)}(Y, R)$. It may be verified that $k > 0$, since A is contractible in X , that $n = k(q+1) + q$ and that

$$\left. \begin{array}{ll} H^i(Y, R) \approx R & \text{for } i = 0, q+1, \dots, k(q+1) \\ H^i(Y, R) = 0 & \text{for all other values of } i. \end{array} \right\} \quad (1.4)$$

⁵⁾ This will be the case, for example, if $X = Y$ and $f = 1$.

Let $S^n \rightarrow Y$ be a bundle mapping with a connected fibre F . Then F is an ANR , which is contractible in S^n except in the trivial case $F = S^n$. Therefore we have :

Corollary (1.5). *If F is homeomorphic to $A_1 \times A_2$, then one of A_1, A_2 is an AR .*

The results (1.2), (1.5) above extend the two theorems concerning the fibering of Euclidean spaces and spheres by tori which are proved in [4]. Also (1.5) extends a theorem due to A. Borel ([1], [2], p. 165). It will be seen that our (1.3) is an easy corollary of (1.1) together with this theorem of Borel's.

2. Let P, Q be topological spaces which are either locally finite CW -complexes or ANR compacta. Then so are $P \times Q$ and

$$P \vee Q = (P \times q_0) \cup (p_0 \times Q) \subset P \times Q ,$$

where p_0, q_0 are points in P, Q , which are 0-cells if P, Q are CW -complexes. Let P, Q be imbedded in $P \vee Q$ so that $p = (p, q_0)$, $q = (p_0, q)$ for each point $p \in P$ and each $q \in Q$. Let

$$P \xrightarrow{u} A \xleftarrow{v} Q$$

be given maps such that $u p_0 = v q_0 = a_0$, say, and u is homotopic in X (and hence homotopic rel. p_0) to the constant map $P \rightarrow a_0$. Let

$$g_0 : P \times Q \rightarrow X$$

be defined by $g_0(p, q) = vq$. Then $g_0 P = a_0$ and there is a homotopy $u_t : P \rightarrow X$, rel. p_0 , such that $u_0 p = g_0 p = a_0$, $u_1 p = up$ ($p \in P$). This can be extended, first to a homotopy $u'_t : P \vee Q \rightarrow X$ such that $u'_t q = vq$ if $q \in Q$, and then ([16], p. 228, [15]) to a homotopy $g_t : P \times Q \rightarrow X$. Then $g_1 p = up$, $g_1 q = vq$. Let

$$h : (P \times Q, P \vee Q) \rightarrow (X, A)$$

be the map determined by g_1 . We describe h as *inessential* if, and only if, it is related by a homotopy of the form $(P \times Q, P \vee Q) \rightarrow (X, A)$ to a map with values in A . We describe v as *inessential* if, and only if, it is homotopic, and hence homotopic rel. q_0 , to the constant map $Q \rightarrow a_0$.

Lemma (2.1). *If v is inessential, so is h .*

Let $v_t : Q \rightarrow A$, rel. q_0 , be a homotopy such that $v_0 = v$, $v_1 Q = a_0$. Let $g' : P \times Q \times I \rightarrow X$ be defined by

$$\begin{aligned}
g'(p, q, t) &= g_{1-3t}(p, q) & \text{if } 0 \leq t \leq 1/3 \\
&= v_{3t-1}(q) & \text{if } 1/3 \leq t \leq 2/3 \\
&= u_{3t-2}(p) & \text{if } 2/3 \leq t \leq 1 .
\end{aligned}$$

Then $g'(p, q, 0) = g_1(p, q) = h(p, q)$, $g'(Q \times I) \subset A$ and $g'(P \times Q \times 1) \subset A$. Also $g'(p_0 \times q_0 \times I) = a_0$ and since $g_s(p, q_0) = u_s(p)$ it follows that $g' \mid (P \vee Q) \times I$ is homotopic, rel. $(P \times 0) \cup (Q \times I) \cup (P \times 1)$, to a map in which $(p, t) \rightarrow up$. Therefore (2.1) follows from the homotopy extension theorem, applied to the pair $(P \times Q \times I, K)$, where

$$K = (P \times Q \times 0) \cup (P \vee Q) \times I \cup (P \times Q \times 1) .$$

Notice that we have used the form of the homotopy extension theorem in which the argument spaces are of a special sort and the image space is arbitrary. The definition of h and the proof of (2.1) apply unchanged if X is an ANR , of the sort appropriate to some general category of spaces to which $P, Q, P \times Q$ etc. belong (cf. [6]).

3. *Proof of (1.1).* Let $f' : (X, A) \rightarrow (Y, y_0)$ be the map determined by f . Then

$$f' \circ h : (P \times Q, P \vee Q) \rightarrow (Y, y_0)$$

is defined in the same way as h , in § 2, with g_t, v replaced by $f \circ g_t$ and the constant map $Q \rightarrow y_0$. Therefore it follows from (2.1) that $f' \circ h$ is homotopic, rel. $P \vee Q$, to the constant map c , where $c(P \times Q) = y_0$. Assuming that a homotopy $f' \circ h \simeq c$ can be lifted it follows that h is inessential. Therefore $h \mid P \vee Q$ has an extension $P \times Q \rightarrow A$ and (1.1) follows on taking $P = Q = A$ and $u = v =$ the identical map.

Let f be a bundle mapping and let X be a locally compact, separable metric space. Then X and likewise A and $A \times A$ are obviously C_σ -spaces. Therefore we have, in consequence of the concluding remarks in § 2 and § 11.3 in [13]:

Theorem (3.1). *If $f : X \rightarrow Y$ is a bundle mapping, if X is a locally compact, separable metric ANR and if a fibre, A , is contractible in X , then A is an H -space.*

4. *Proof of (1.3).* Let $g : E \rightarrow B$ be a fibre mapping, with fibre F , where E, B , and hence also F , are compacta. Let $H^i(P) = 0$ for $P = B, E, F$ and all sufficiently large values of i . This will be the case, for example, if $\dim P < \infty$. Also let $H^i(P)$ be finitely generated for all values of i . It follows from the theory of the spectral sequence associated with the mapping g that this will be the case if any two of $H^i(B), H^i(E),$

$H^i(F)$ are finitely generated for every ⁶⁾ i . Therefore it will be the case if $H^*(E) \approx H^*(S^n)$ and F is an ANR . We quote the universal coefficient theorem ⁷⁾

$$H^r(Q, G) \approx H^r(Q) \otimes G + H^{r+1}(Q) * G, \quad (3.1)$$

for the (discrete) Čech cohomology groups of a compactum Q , with coefficients in G . It follows from (3.1) that, if

$$H^m(Q) \approx I_0, \quad H^i(Q) = 0 \quad \text{for } i > m, \quad (3.2)$$

then

$$H^m(Q, G) \approx G, \quad H^i(Q, G) = 0 \quad \text{for } i > m. \quad (3.3)$$

Let $H^j(Q)$ be finitely generated for every $j \geq m$. Then (3.2) is true if (3.3) holds for every field, G , as group of coefficients.

Let E satisfy (3.2) for some $m \geq 0$ and let K be a given field. Then it follows from Theorem (9.1) on p. 189 of [9] that there are integers $r = r_K$, $s = s_K$ such that $r + s = m$ and

$$\left. \begin{aligned} H^r(B, K) &\approx K, & H^i(B, K) &= 0 & \text{if } i > r, \\ H^s(F, K) &\approx K, & H^j(F, K) &= 0 & \text{if } j > s, \end{aligned} \right\} \quad (3.4)$$

in which \approx indicates isomorphism between vector spaces over K . Let $k = r_R$, $l = s_R$. Since $H^i(B)$, $H^i(F)$ are finitely generated it follows from (3.1) and (3.4), with $K = R$, that

$$H^k(B) \approx I_0 + T, \quad H^l(F) \approx I_0 + T',$$

where T , T' are finite groups. Hence, and from (3.1), it follows that $H^k(B, K)$ and $H^l(F, K)$ each contains a summand which is isomorphic to K . Therefore $k \leq r$, $l \leq s$ and since $k + l = m = r + s$ we have $k = r$, $l = s$. Thus r , s are independent of the choice of K . Therefore B , F satisfy (3.2) with m replaced by r or s according as $Q = B$ or F .

Let $f: X \rightarrow Y$ and A be as in (1.3). Then $H^*(X) = H^*(S^n)$ and it follows from the preceding paragraph that

$$\left. \begin{aligned} \text{a) } H^p(Y) &\approx I_0, & H^i(Y) &= 0 & \text{if } i > p \\ \text{b) } H^q(A) &\approx I_0, & H^j(A) &= 0 & \text{if } j > q \end{aligned} \right\} \quad (3.5)$$

⁶⁾ The argument is essentially the same as the one on p. 465 of [12]. See also § 9 of [9]

⁷⁾ See Theorem 44.2 on p. 823 of [5], in which the term $H^{r+1}(Q) * G$ is expressed differently. The only property of this "product" which we need is that $H * G = 0$ if either $H = 0$ or if G has no (non-zero) element of finite order. We use $+$ to indicate direct summation.

for some pair of integers p, q such that $p + q = n$. Moreover A , being contractible in X , is an H -space, according to (1.1).

First assume that $q = 0$. Then it follows from (5.1) on p. 346 of [10] that $H_i(A) = 0$ for every $i > 0$, where $H_i(A)$ is the i^{th} discrete, integral Čech homology group of A . Since A is an ANR it follows that $H'_i(A) = 0$ if $i > 0$ where $H'_i(A)$ is the i^{th} singular homology group of A ([11], p. 107). Hence it follows, as in the proof of (1.2), that A is an AR . If A is homeomorphic to $A_1 \times A_2$, then A_1 is homeomorphic to a retract of A . Therefore it follows that A_1 is an AR . This proves (1.3) if $q = 0$ and we proceed on the assumption that $q > 0$.

Since A is an H -space and $H^j(A) = 0$ if $j > q$ we have ([8], No. 24)

$$H^*(A, R) \approx H^*(S^{i_1} \times \dots \times S^{i_p}, R)$$

for certain odd values of i_1, \dots, i_p . Since $H^*(X) \approx H^*(S^n)$ it follows from [1] and [2], p. 165, that $p = 1$. Thus

$$H^*(A, R) \approx H^*(S^q, R), \quad (3.6)$$

where q is odd. This proves (1.3a).

Let A be homeomorphic to $A_1 \times A_2$. On taking $g : E \rightarrow B$ to be the projection $A_1 \times A_2 \rightarrow A_2$, with F homeomorphic to A_1 , it follows from (3.5b) and (3.4) that

$$H^{q_j}(A_j) \approx I_0, \quad H^i(A_j) = 0 \quad \text{if} \quad i > q_j,$$

for some pair of integers q_1, q_2 such that $q_1 + q_2 = q$. The group $H^{q_j}(A_1 \times A_2, R)$ contains a summand which is isomorphic to $H^{q_j}(A_j, R)$. Hence it follows from (3.6) that $q_j = 0$ or q . Since $q_1 + q_2 = q$ it follows that either $q_1 = 0$ or $q_2 = 0$, say $q_1 = 0$. Since A_1 is homeomorphic to a retract of A it is an ANR . Since $\pi_1(A) \approx \pi_1(A_1) \times \pi_1(A_2)$ and $\pi_1(A)$ is Abelian, because A is contractible in X , it follows that $\pi_1(A_1)$ is Abelian. Therefore it follows from an argument similar to the one used above to dispose of the case $q = 0$ that A_1 is an AR . This completes the proof.
