Short note

On the sums of Fibonacci and Lucas sequences or the art of cancelling $1 - x$

Dura Paunić

Let $\{F_n : n \in \mathbb{N}_0\} = \{0, 1, 1, 2, 3, 5, \dots\}$, and $\{L_n : n \in \mathbb{N}_0\} = \{2, 1, 3, 4, 7, 11, \dots\}$, be sequences of Fibonacci, and Lucas numbers. Their generating functions are

$$F(x) = \frac{x}{1-x-x^2} = \sum_{n=0}^{\infty} F_n x^n, \quad \text{and} \quad L(x) = \frac{2-x}{1-x-x^2} = \sum_{n=0}^{\infty} L_n x^n.$$

Recently, Sury [3], and Marques [2] established the Fibonacci–Lucas relations

$$\sum_{k=0}^n 2^k L_k = 2^{n+1} F_{n+1}, \quad \text{and} \quad \sum_{k=0}^n 3^k L_k + \sum_{k=0}^{n+1} 3^{k-1} F_k = 3^{n+1} F_{n+1}.$$

The first identity was elegantly proved by Kwong [1].

These two identities can be generalized easily using generating functions.

Let $G(x) = g_0 + g_1 x + g_2 x^2 + \dots + g_n x^n + \dots$, be any generating function. It follows that the coefficient of x^n is

- a) $m^n g_n$, for $G(mx)$,
- b) g_{n-1} for $xG(x)$, $n > 0$,
- c) g_{n+1} for $\frac{G(x)}{x}$, $n \geq 0$,
- d) $\sum_{k=0}^n g_k$, for $\frac{G(x)}{1-x} = \sum_{j=0}^{\infty} g_j x^j \times \sum_{k=0}^{\infty} x^k$.

Then for $m > 0$, $\sum_{k=0}^n m^k L_k + (m-2) \sum_{k=0}^{n+1} m^{k-1} F_k$, is the coefficient of x^n in

$$\begin{aligned} & \frac{L(mx)}{1-x} + \frac{(m-2)F(mx)}{mx(1-x)} \\ &= \frac{2-mx}{(1-x)(1-(mx)-(mx)^2)} + \frac{(m-2)mx}{mx(1-x)(1-(mx)-(mx)^2)} \\ &= \frac{m}{1-(mx)-(mx)^2} = \frac{F(mx)}{x}. \end{aligned}$$

So, for nonnegative integer n , and real $m > 0$, the identity

$$\sum_{k=0}^n m^k L_k + (m-2) \sum_{k=0}^{n+1} m^{k-1} F_k = m^{n+1} F_{n+1}$$

holds.
