Since the torus knot groups are the only knot groups with non-trivial center the groups of all other knots cannot be lattices in $\mathbf{R} \times PSL_2(\mathbf{R})$.

9.2. So we now consider knots which are not torus knots; their groups can be lattices in $PSL_2(\mathbf{C})$ only. As for $PSL_2(\mathbf{C})$, it is the isometry group of hyperbolic 3-space $\mathbf{H}^3$. The knot complement C is a Haken 3-manifold with zero-Euler characteristic. It is atoroidal precisely if the respective knot does not have a companion; we use here "companion" in the sense of non-trivial companion. Indeed the boundary torus of a regular neighborhood of a companion would be a non-boundary-parallel incompressible surface in C. Thus by Thurston's Hyperbolization Theorem the interior of the complement of a knot without companion can be given a hyperbolic structure with finite volume coming from $\mathbf{H}^3/G$. In other words that knot group G is a lattice in $PSL_2(\mathbf{C})$ and the interior of C can be identified with the open manifold $\mathbf{H}^3/G$.

Concerning the notion of companion see [Ro, p. 111]. For concepts related to the Hyperbolization Theorem and to properties of 3-manifolds we refer to [K].

9.3. If the knot has a companion then the knot complement is not atoroidal and its interior does not admit a hyperbolic structure [K, Cor.4.63]. It follows that G cannot be a lattice in (the only remaining possibility) $PSL_2(\mathbf{C})$. We sketch the proof: If G is such a lattice then $\mathbf{H}^3/G$ is a $K(G,1)$-manifold as well, thus homotopy equivalent to C. The homotopy equivalence can be turned into a diffeomorphism mapping $\mathbf{H}^3/G$ to the interior of the knot complement C which thus would receive a hyperbolic structure with finite volume.

THEOREM 9.1. *Torus knot groups are lattices in* $\mathbf{R} \times PSL_2(\mathbf{R})$. *As for other groups of knots, those of knots without companion are lattices in* $PSL_2(\mathbf{C})$, *and those of knots with companion are not lattices in any connected Lie group.*
