# Non-regularity of the Coulomb potential in quantum electrodynamics

by **Martin Klaus**

Department of Mathematics, University of Virginia, Charlottesville, Virginia 22903, USA

(21. I. 1980)

**Abstract.** The operator  $P_+(\lambda) - P_+^o$  is not Hilbert-Schmidt if  $P_+^o$  resp.  $P_+(\lambda)$  denote the spectral projections of  $[0, \infty)$  for the operators  $H_0 = \alpha p + \beta$ , resp.  $H = \alpha p + \beta - \lambda/|x|$  and  $\lambda \in (0, 1)$ . This implies that a static external Coulomb field is non-regular in the sense of [1].

## 1. Introduction

We consider the free Dirac operator

$$H_0 = \alpha p + \beta \quad (1.1)$$

in interaction with a static electric Coulomb field, i.e., the Hamiltonian

$$H(\lambda) = \alpha p + \beta - \frac{\lambda}{|x|} \quad 0 < \lambda < 1 \quad (1.2)$$

In our study of the external field problem [1, 2] in quantum electrodynamics, the question arose whether a so-called strong Bogoliubow transformation exists which relates the free field to the interacting field. The mathematical problem is to prove or disprove that

$$P_+(\lambda) - P_+^o \in \text{H.S.} \quad (1.3)$$

is Hilbert-Schmidt (cf. [1, p. 794]). Here  $P_+^o$  resp.  $P_+(\lambda)$  are the spectral projections of  $[0, \infty)$  for  $H_0$  resp.  $H(\lambda)$ . For less singular potentials than Coulomb this question has been studied in [1] and in more detail in [3]. The latter reference contains both necessary and sufficient conditions on the potential  $V$  so that (1.3) holds for the pair  $H_0, H_0 + V$ . If (1.3) holds we call the potential *regular*, if not we call it *non-regular*. It has been shown in [3] that potentials whose Fourier transform  $\tilde{V}$  obeys

$$\int d^3p \frac{p^2}{1+p^{1-\epsilon}} |\tilde{V}(p)|^2 < \infty \quad (1.4)$$

for some  $\epsilon > 0$  are *regular*, but if

$$\int d^3p \frac{p^2}{1+p^{1+\epsilon}} |\tilde{V}(p)|^2 = \infty \quad (1.5)$$

for some  $\epsilon > 0$ ,  $V$  is *non-regular*. Hence the case of the Coulomb potential ( $\tilde{V} \sim 1/p^2$ ) cannot be decided on the basis of (1.4) and (1.5). In Section II we

prove that the Coulomb potential is non-regular. This fact is due to the strong singularity at the origin.

## II. Non-regularity of $1/|x|$

We will prove

**Theorem 1.**  $P_+(\lambda) - P_+^\circ$  is not Hilbert-Schmidt for any  $\lambda \in (0, 1)$ .

*Remarks.* (1) The phrase “by dilation” means that we perform a unitary transformation

$$(U_\sigma f)(x) = \sigma^{3/2} f(\sigma x) \quad (2.1)$$

for some  $\sigma > 0$ .

Notice that as  $\sigma \rightarrow 0$

$$U_\sigma f \rightarrow 0 \quad (2.2)$$

weakly.

(2) We have

$$U_\sigma \left( \alpha p + \beta - \frac{\lambda}{|x|} \right) U_\sigma^* = \frac{1}{\sigma} \left( \alpha p + \sigma \beta - \frac{\lambda}{|x|} \right) \quad (2.3)$$

(3) Without going into details we mention that for  $\lambda \in (\sqrt{3}/2, 1)$  we take for  $H(\lambda)$  the physically distinguished self-adjoint extension of Schmincke [4], Wüst [5] and Nenciu [6]. We also know that this gives the operator of the quantum mechanics textbooks. Hence the ground state of  $H(\lambda)$  is at  $\sqrt{1 - \lambda^2}$ .

*Proof of Theorem 1.* Suppose  $P_+(\lambda) - P_+^\circ$  were Hilbert-Schmidt. From (2.1) and the compactness of  $P_+(\lambda) - P_+^\circ$  we conclude that

$$U_\sigma (P_+(\lambda) - P_+^\circ) U_\sigma^* \rightarrow 0 \quad (2.4)$$

strongly as  $\sigma \rightarrow 0$ .

We will show that this leads to a contradiction. From [1, p. 795]

$$P_+^\circ = \frac{1}{2} \left( 1 + \frac{\alpha p + \beta}{\sqrt{p^2 + 1}} \right) \quad (2.5)$$

so that

$$U_\sigma P_+^\circ U_\sigma^* = \frac{1}{2} \left( 1 + \frac{\alpha p + \beta \sigma}{\sqrt{p^2 + \sigma^2}} \right) \rightarrow \frac{1}{2} \left( 1 - \frac{\alpha p}{p} \right) \equiv \tilde{P}_+^\circ \quad (2.6)$$

strongly as  $\sigma \rightarrow 0$ .

Using

$$P_+(\lambda) = \frac{1}{2} + \frac{1}{2\pi} \lim_{\rho \rightarrow \infty} \int_{-\rho}^{\rho} \frac{d\eta}{H(\lambda) - i\eta} \quad (2.7)$$

and (2.3) we get

$$\begin{aligned}
 (f, U_\sigma P_+(\lambda) U_\sigma^* f) &= \frac{1}{2} + \frac{1}{2\pi} \lim_{\rho \rightarrow \infty} \int_{-\rho}^\rho \left( f, \frac{\sigma}{\alpha p + \sigma\beta - \frac{\lambda}{|x|} - i\eta\sigma} f \right) d\eta \\
 &= \frac{1}{2} + \frac{1}{2\pi} \lim_{\rho \rightarrow \infty} \int_{-\rho\sigma}^{\rho\sigma} \left( f, \frac{1}{\alpha p + \sigma\beta - \frac{\lambda}{|x|} - i\eta} f \right) d\eta \\
 &= (f, P_+^\sigma(\lambda) f)
 \end{aligned} \tag{2.8}$$

so that

$$U_\sigma P_+(\lambda) U_\sigma^* = P_+^\sigma(\lambda) \tag{2.9}$$

where  $P_+^\sigma(\lambda)$  is the spectral projection onto  $[0, \infty)$  for  $\alpha p + \sigma\beta - (\lambda/|x|)$ . Obviously as  $\sigma \rightarrow 0$

$$\alpha p + \sigma\beta - \frac{\lambda}{|x|} \rightarrow \alpha p - \frac{\lambda}{|x|} \tag{2.10}$$

strongly on  $D(H(\lambda))$  and hence also in strong resolvent sense. Therefore, if  $\text{Ker}(\alpha p - (\lambda/|x|)) = \{0\}$ ,

$$P_+^\sigma(\lambda) \rightarrow \tilde{P}_+(\lambda) \equiv \tilde{P}_+ \quad \text{as } \sigma \rightarrow 0 \tag{2.11}$$

strongly where  $\tilde{P}_+$  is the spectral projection onto  $[0, \infty)$  for  $\alpha p - \lambda/|x|$  [7, p. 432]. To show that  $\alpha p - \lambda/|x|$  has indeed a trivial kernel one can either inspect the differential equations in the invariant subspaces of given angular momentum or one can argue as follows: If the kernel were non-trivial it would have infinite dimension for suppose  $Q$  were the projection onto the kernel and  $\dim Q < \infty$ . Since  $\alpha p - \lambda/|x|$  commutes with dilations up to a factor (see Remark 2) we have  $1 = \|Q\| = \|QU_\sigma\| \rightarrow 0$  since  $\dim Q < \infty$ . This is impossible. Hence  $\dim Q = \infty$  in each subspace of fixed angular momentum. But this is impossible since there exists at most two linearly independent solutions in each subspace [8]. By (2.6), (2.9) and (2.11)

$$U_\sigma(P_+(\lambda) - P_+^\circ) U_\sigma^* \rightarrow \tilde{P}_+ - \tilde{P}_+^\circ \tag{2.12}$$

So in view of (2.3) we need only show that  $\tilde{P}_+ - \tilde{P}_+^\circ$  is non-zero. Suppose  $\tilde{P}_+ = \tilde{P}_+^\circ$ . Then with  $\tilde{P}_-^\circ = 1 - \tilde{P}_+^\circ$ ,  $\tilde{P}_- = 1 - \tilde{P}_+$

$$\begin{aligned}
 0 &= \tilde{P}_- \left( \alpha p + -\frac{\lambda}{|x|} \right) \tilde{P}_+ = \tilde{P}_-^\circ \left( \alpha p - \frac{\lambda}{|x|} \right) \tilde{P}_+^\circ \\
 &= \tilde{P}_-^\circ (\alpha p) \tilde{P}_+^\circ - \lambda \tilde{P}_-^\circ \frac{1}{|x|} \tilde{P}_+^\circ
 \end{aligned} \tag{2.13}$$

where these equalities hold on  $D(\alpha p) \subset D(\alpha p - \lambda/|x|)$ . (The latter inclusion follows from the fact that  $C_0^\infty(R^3)$  is a core for  $\alpha p$  and  $1/|x|$  is  $(\alpha p)$ -bounded.) But  $\tilde{P}_-^\circ(\alpha p) \tilde{P}_+^\circ = 0$  and

$$\tilde{P}_-^\circ \frac{1}{|x|} \tilde{P}_+^\circ \neq 0 \tag{2.14}$$

To see (2.14) consider for instance the matrix kernel in momentum space. Hence (2.13) is not true. This finishes our proof of Theorem 1.

## Acknowledgements

It is a pleasure to thank Prof. G. Scharf for some useful remarks about this paper.
